

Logo and website SoW for 235 Electric

14 May 2026

Customers/suppliers

There are two primary target audiences for the logo, website, linkedin

- Customers: the primary purchasers are data center operators
 - NVIDIA, Equinix, Polarize, Telehouse data center services, borealis data centers, AT north... top 25 in the US: <https://www.abiresearch.com/blog/top-25-largest-data-center-companies-united-states>
 - Should also be focused on EU and SE Asia based data center operators
 - Also focused on power providers for data centers, the ones that data centers contract to purchase power solutions: <https://www.inven.ai/company-lists/top-21-data-center-power-solution-companies>
- Suppliers: nuclear reactors
 - A primary activity is trying to get nuclear reactors to allow us to irradiate Co59 to Co60 ourselves, this is our power source for the generators
 - We are in talks specifically with CVR in Czech republic, SNN in Romania, CNL in Canada, there are many others: EDF France, Korea Electric Power Corp (KEPCO), Constellation Energy Corp, NextEra Energy, Duke Energy, Entergy... these are big companies, traditional, large scale, state owned or major utility companies, they are managing large reactors that cost 100M+ and operate for 30+ years, they have usually minimum 200 employees up to 1000
 - This drives our cost: Co60 capsules that we can manufacture with these reactors are 90% of the cost of our product, and since they are conservative it's important the website and marketing appeals to this kind of audience and decision maker

Regulatory considerations as well:

- Nuclear is a super regulated industry, compliance is important and there is a lot of negative PR from nuclear accidents in the past, which makes license providers and legal expensive and risky
- It's important that government decision makers in the US that check our website or linkedin are not perceiving a high risk company and that we are not showing up on their radar as a problem: safety, reliability, compliance, these kinds of messages are important to transmit to this type of audience

Logo

- This is the placeholder logo -> **235 Electric**
 - The data layer server stack on the left side look like a barrel of nuclear waste material, this should be changed
- What should be communicated is:
 - Power source is nuclear
 - Pros: green energy, baseload power, consistent, perpetual reliability, always on, high energy density
 - For data centers: some kind of chip, server, computer:
- For the nuclear component:
 - Trifol symbol should be avoided, represents danger in technical context (ISO 361 standards), same with toxicity or other warning symbols 
 - Other symbols better as substitutes: electron orbitals

Website

- Four pages
 - About: 235 Electric is building radioisotope generators for data centers in the 1-100kW power ranges
 - Customers (technology): we use Co60 as the power source, taking advantage of the high energy density and commercial availability in standard format. We use thermophotovoltaic cells to convert the heat to electrical power, taking advantage of recent developments and increases in efficiency. A page that shows the product. See the RTG brief document for some images and product information
 - Investors: the information in the three slides below this one
 - Contact: box that sends a message to tamas@235electric.com. Address is 1209 Orange St, Wilmington, Delaware 19801
- Focus on product advantages:
 - High efficiency with 40% efficiency of TPV conversion and state of the art BSR back surface reflector
 - No moving parts: no mechanical failures, no steam engine or turbine: uses semi conductor systems to generate power
 - Reliable with up to 15 years of power generation (five half-lives of Co60 isotope)
 - Modular, easily deployable
 - Cooling systems included
- For investors
 - Competitive advantages table (slide below)
 - Deployment and scalability
 - Minimal OPEX, costs are in CAPEX

Competitive advantages relative to other products

Type	Isotopic	Grid power	Solar/Wind	Natural gas	Diesel generator	Hydrogen fuel cell
Power density (W/sq-ft)	Very compact (< 10)	N/A	Wide area (1200++)	Adequate (40)	Fair (50)	Adequate (40)
Availability	99.9999 %	99 %	20-30 % (Intermittent)	95-97 %	85 %	98 % (fuel limited) ^{1.}
Operational Life	15+ years	N/A	5-10 years	5-8 years	3-5 years	5-10 years
Refueling Cycle	None	Continuous	None	Continuous (pipe or tank)	7-14 days	30-60 days ^{2.}
Carbon Emissions (g CO2/kWh)	0	350-500	20-50	450-600	700+	0-50
Acoustic Profile	0 dB	40 dB (Repetitive switch)	50 dB (Repetitive switch)	60-70 dB	Loud (80+ dB)	50 dB (Fans)
Heat Recovery	Zero	Zero	Zero	High (exhaust)	Moderate	Moderate (Low grade)
Scalability	Modular (simple)	Unlimited	High Land/Limited	High/Linear	High/Linear	Modular
Maintenance	0 (No moving parts)	0 (No moving parts)	0 (No moving parts)	Fuel movement	Regular (24hrs)	Regular (24hrs)

Deployment and scalability

1. As a self enclosed module, scalability is straightforward: units are placed side by side, and an electrical line provides power at standard outputs.
 1. 400 VAC / 50 Hz → 6.5 kWel peak output per engine, resulting in a total of 8 engines for a 50 kWel system
 2. 480 VAC / 60 Hz → 7.5 kWel peak output per engine, resulting in 7 engines for a 50 kWel system
2. Lead time is low and multiple units can be delivered within a few months: this is power today, not in 10 years.
3. Buy power as you need it: power 10% of your data center to sell compute to your customers today, and defer your CAPEX compared to a 10-year nuclear plant or equivalent long lead time high cost power infrastructure.

Units placed outside, at 85C surface temperature. No additional cooling costs in the data center

TCO Structure Comparison: Updated Isotopic CAPEX (\$1.5M)
(10kW Baseline over 28 Years)

1. High initial CAPEX offset by elimination of electricity bills and carbon taxes for two decades. Your data center is shielded from 28 years of inflation, carbon taxes, and 700+ fuel truck delivery price fluctuations.
2. Cumulative OPEX is 12x less than a diesel generator and does not increase year on year.
3. Zero Fuel Volatility: The "fuel" is pre-loaded; there are no monthly gas bills or carbon credits. Isotope reliability means no unexpected downtime. No hidden costs.
4. Constantly available: in remote or mission critical settings, isotope power provides continuous baseload power for 28 years, 24/7, nonstop.
5. Maintenance: Minimal moving parts compared to diesel turbines. Only 2 hours of maintenance per year, done by experienced technicians.
6. Risk mitigation asset. No risk of a missed fuel delivery: a complex logistical supply chain is replaced with a simple, depreciable asset.

LinkedIn

<https://www.linkedin.com/company/235electric/about/>

- Need a one liner description: “Nuclear generators that provide quiet, clean energy for data centers” or something similar for the overview section
- Need a cover image that showcases either the product or transfers information to customers, can be abstract
- Need 3 or 4 posts, super simple, text + images, something like these ones from Frauscher Motors company:
 - <https://www.linkedin.com/company/frauscher-motors/posts/?feedView=all>
